

# Greenhouse Gas Accounting and Reporting

## Measure your carbon footprint and create your sustainability roadmap using data-driven insights and actionable strategies.

As businesses target climate action and sustainability as part of their overall energy goals, it can be challenging to understand and calculate your company's carbon footprint due to the evolving complexity of the process and lack of the right tools and resources. Constellation provides a new and innovative approach that helps you take the guesswork out of your carbon reduction strategy using automation and artificial intelligence.

Our carbon accounting and emissions management platform allows you to develop a baseline of your carbon emissions, report it across multiple frameworks, and to identify and prioritize carbon reduction or offset actions you can implement.

By monitoring and visualizing energy consumption and emissions data, we can help you:

- Automate and streamline the measurement of your Scope 1, 2 and 3 greenhouse gas emissions
- Measure your emissions contributions at a single-site or across your portfolio
- Visualize your carbon footprint today and scenarios in the future
- Help set viable and impactful climate targets, considering your industry and location
- Track your climate targets, projects, and budgets in one place to clearly communicate with stakeholders

Contact us today to learn how we can help your business leverage our services and maximize success on your sustainability journey.
